

More Revenue, Less Work

- Drastically Reduce PCI Compliance Scope
- Plug-in to existing workflow for a complete payment solution
- Speed time to market through rapid integration
- Access multiple payment services
- Add SaaS web payments to create a multi-channel offering
- Create a new SaaS revenue stream with no additional infrastructure

Secure Hosted Payments for Invoicing

Add Secure Hosted Payments to Your Workflow

The Secure Hosted Payments (SHP) for Invoicing API opens the door to a secure hosted processing workflow allowing you to include a brandable, secure hosted payment page in your payment workflow – dramatically reducing your PCI burden and development time.

As Easy as 1-2-3

The API provides access to a simple 3 step secure payment workflow that includes:

- 1) encrypted payment code/URL creation
- 2) secure payment acceptance
- 3) reconciliation of payment information back into your core application

Payment-Enable Anything

With the SHP for Invoicing API you instantly generate a payment code/URL that includes configurable payment details, methods and terms directly from your application. Use the code/URL to create payment-enabled links, buttons, invoices, work orders, emails – anything you want – then, accept payment through a secure, online payment page.

Keep the Functionality, Lose the Risk

A secure, hosted payment page facilitates always-on, real-time payment acceptance through a web interface branded for each business. The hosted payment environment streamlines business operations with instant access to multiple service providers and multiple payment services including credit, debit and electronic checking with configurable payment options. The secure payment page protects customer credit card information, reduces your PCI Compliance scope and expedites your development efforts.

Streamline the Back Office

The Secure Hosted Payment's data services track and record payment activity across the workflow – allowing you to query payment status and provide real-time payment notification and reconciliation back into your application.

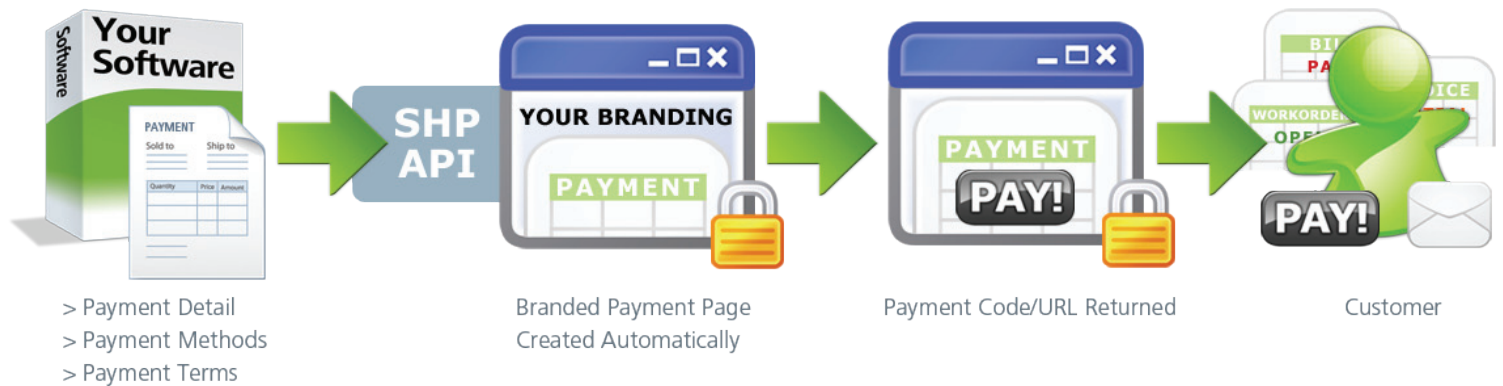

About Commerce APIs

Commerce APIs interact with your application and the IP Commerce Managed Commerce Services Platform to help you create powerful, workflow-oriented solutions.

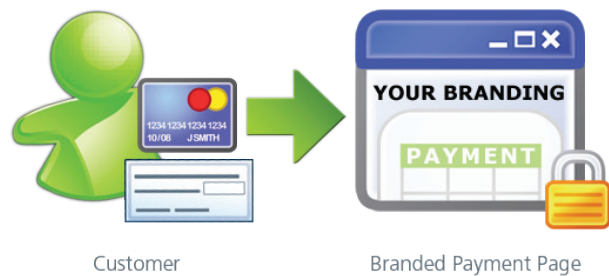

3 Step Secure Hosted Payment Workflow

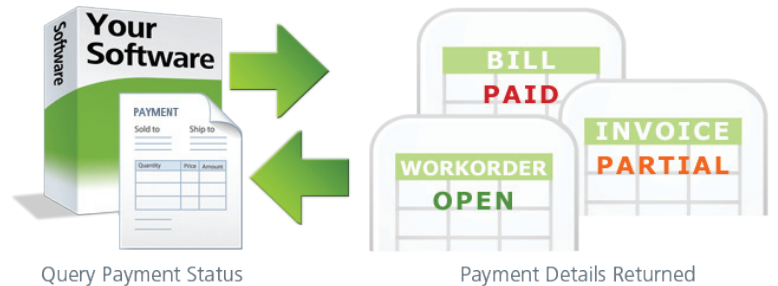

1 Payment Code/URL Creation

2 Secure Payment Acceptance

3 Reconciliation
