# Transaction Management Services (TMS)

## Transaction Workflow Automation for Applications

Data services are an essential part of the payment workflow. TMS leverages IP Commerce Data Services and federated identity capabilities to help you quickly and simply optimize and expand your solution offerings with plug-and-play ease.

## Advanced Transaction Management

TMS eliminates the need for your application to store transaction data locally by providing secure access to the transaction data needed for settlement, incremental authorizations, voids, refunds and transaction reporting - enabling you to offer more services and reach more customers without added workflow development.

## More Features - Less Development

With a full suite of transaction services, TMS provides everything you'll need to add transaction management capabilities to your existing workflow. Access real-time transaction data, search and filter individual or grouped transactions, and access established settlement, void and refund workflows to quickly add new features to your application.

## Simple Implementation

Incorporate transaction management services seamlessly into your existing Commerce Web Services (CWS) – based applications with two flexible integration options:

- **Transaction Management Module**  
Quickly add transaction management services to your existing workflow with no added development effort using the Transaction Management Module – a TMS-enabled turn-key web app customized to match your brand.
- **Transaction Management Service API**  
Fully integrate TMS into your solution using the Transaction Management Service API – a fully configurable web service that gives your application safe, secure access to transaction data.

### About IP Commerce

IP Commerce provides the first cloud-computing platform for commerce. The Managed Commerce Services Platform enables service providers and software companies to become solution providers enabling new workflows and processes on-demand.
